IWM

PRIVATE MARKET RESEARCH / WEB EXPERIENCE DESIGN

IWM ACADEMY

Infinite World Market Academy

ROYAL GREEN 2.0
COMPLETE WEBSITE & MEMBERSHIP BLUEPRINT

Five research desks including Swing Trade. Interactive buy, sell, stop-loss, target and exit demonstrations. User-friendly membership purchase, payment, renewal and access management.

SOFTWARE ENGINEER HANDOFF • 09 NOVEMBER 2026

01 / IMPLEMENTATION BLUEPRINT

What changes on the live website

Objective: make IWM Academy look like a serious private research organization while ensuring a first-time visitor can understand the offering and choose a membership without a complicated journey.

Review of accessible homepage

The publicly accessible website content lists 200K Group, Small Cap Group, Earnings Group and Tough Market Group, plus month / 6-month / annual options and a bundle. Swing Trade was not visible in that accessible homepage content. This redesign treats Swing Trade as the fifth desk based on the owner's direct instruction; confirm its current plan and delivery details in the production catalogue.

Current issue	Royal Green 2.0 response
Four groups dominate the public homepage	Show all five as differentiated strategy desks; make Swing Trade prominent.
Subscription descriptions read like generic alert groups	Lead with a detailed, visually engaging sample trade walkthrough.
Discord is the main value presentation	Show IWM as a member research terminal; Discord is a communications channel.
Pricing language contains unrelated AI automation copy	Use investment research terminology and verified subscription prices.
Visitors must infer how a trade is managed	Expose entry, stop, target 1, target 2 and sell / cover exit plus update history.

ONE-SCREEN VALUE PROPOSITION: “Every trade begins with a plan.” The primary button opens a realistic illustrative trade; the second opens membership selection.

Full concept package

- Standalone HTML prototype: interactive desk example switcher, 5 desk cards, membership selection, demo signup and member portal.
- Engineer blueprint: this PDF, data contracts, payment/entitlement rules, usability and launch acceptance checklist.

02 / IMPLEMENTATION BLUEPRINT

Visual design system: Royal Green luxury

Design token	Specification
Deep midnight green	#061B15 - full-site base and primary header
Emerald forest	#0B3426 / #10392B - card layers and terminal surfaces
Royal green action	#16835B / #21875F - primary CTA and selected control
Ivory	#F7F6F0 - editorial headings and high-contrast labels
Muted mint	#9ED7B8 / #AAC2B2 - secondary emphasis and utility text
Champagne	#C8B88D - rare premium detailing; not bright metallic effects
Typography	Large editorial serif for major statements; clean sans-serif for functional detail.
Brand lockup	Oversized crest plus IWM ACADEMY. Keep INFINITE WORLD MARKET ACADEMY directly underneath. Desktop crest 72px; mobile 58px.
Layout	Max 1320px desktop container; generous whitespace; one-column mobile content; no horizontal scroll.
Motion	Understated hover and state transitions; honor reduced-motion preferences.

Homepage architecture (in order)

- 01. Oversized IWM identity, clear headline and two meaningful actions.
- 02. Interactive sample trade: long and short examples with exact levels.
- 03. Four-step lifecycle: published plan → trigger → update → exit/review.
- 04. All five desk cards, Swing Trade spotlight, optional all-desk bundle.
- 05. Member terminal preview: desk content, chronological updates, self-directed journal and billing.
- 06. Two-choice membership form: desk + term.
- 07. Plain-language FAQ; clear terms and risk statements; repeated final CTA.

On mobile

Header remains prominent without hiding content. Use a small navigation drawer and a persistent “Explore memberships” button. Cards stack; numeric trade data stays readable in two-column grids. Minimum primary touch height: 44px.

03 / IMPLEMENTATION BLUEPRINT

All five desks and display names

Internal desk key	Public display name	Mapped / positioning
largecap_ai	Large-Cap & AI Desk	Existing 200K Group; liquid AI / technology names; short-term plans.
swing	Swing Trading Desk	Swing Trade; multi-day opportunities and position-management updates.
smallcap	Small Cap Desk	Existing Small Cap Group; intraday momentum and controlled risk.
earnings	Earnings Desk	Existing Earnings Group; events and earnings-volatility research.
tough	Tough Market Desk	Existing Tough Market Group; selective plans during difficult conditions.
all	All Desks Bundle	Only if product catalogue permits; entitlement to each paid desk.

Every desk detail screen must answer four questions

- Who it is for - short-term, swing, small-cap momentum, earnings or risk-focused members.
- What it contains - research notes, planned setups, update cadence, sessions, archived examples as applicable.
- How trades are communicated - exact entries, stops, targets, changes and exit notes with timestamps.
- How the subscription works - verified price, term, renewal rules, cancellation and desk-specific access.

Avoid unsupported claims such as guaranteed returns, consistent profits, live trade execution, automated brokerage portfolio management or verified winning percentages. Desks sell the structure of the service, not a promised outcome.

04 / IMPLEMENTATION BLUEPRINT

The sample trade experience visitors will see

The homepage uses a single interactive module. Selecting a desk swaps in a complete synthetic trade, including exact numbers and a chart showing entry, stop loss, both targets and a sample exit. Clearly display “Synthetic example / not live market data.”

Desk / side	Entry	Stop loss	Target 1	Target 2	Sample exit
Large-Cap & AI / Buy	$182.40	$176.90	$191.20	$198.00	Sell $191.20
Swing Trade / Buy	$124.50	$118.75	$133.00	$140.20	Sell $133.00
Small Cap / Buy	$8.20	$7.78	$8.95	$9.65	Sell $8.95
Earnings / Short	$74.50	$77.10	$70.20	$66.80	Cover $70.20
Tough Market / Short	$96.80	$100.20	$91.30	$88.20	Cover $91.30

Trading semantics and trust

- For long plans, use BUY ENTRY → SELL EXIT, with stops below entry as appropriate.
- For short plans, use SELL SHORT ENTRY → BUY TO COVER, with stops above entry as appropriate.
- Show both take-profit levels even when the scenario closes at target 1.
- Never call the sample “live,” a completed real trade, a subscriber gain, or historical performance.
- Do not display fictional dates, fills, broker order execution or claimed results. The example chart is synthetic.
- In the real logged-trade area, each modification requires author, time and change reason.

What happens when a plan is invalidated?

Support “never triggered,” “cancelled,” “stop reached,” “partially closed” and “fully closed” as legitimate outcomes. Preserve them in the archive so marketing does not select only favorable exits.

05 / IMPLEMENTATION BLUEPRINT

Member terminal: purpose and exact modules

Module	Member-visible behavior
Overview	Membership status, purchased desk(s), newest research, next renewal and onboarding checklist.
My Desks	Access only the purchased strategy desk(s); current research and educational videos.
Trade Plans	Searchable list with ticker, direction, entry, stop, targets, trigger state, author and published timestamp.
Trade Record	Initial plan plus append-only updates; precise entry/exit; changes; note on whether a level was filled or only suggested.
Trade Archive	Closed, invalidated, cancelled and untriggered setups. No selective reporting as actual portfolio returns.
My Journal	Optional member-entered entries/exits; personal notes and self-directed P/L; no implied brokerage synchronization.
Discord	Connect account through OAuth; show desk-specific channels and sync status.
Membership & Billing	Current term, verified paid-through date, invoices, renewal state, payment method update and cancel future renewal.

How to show an individual trade

Header: instrument + exchange + direction + status. Main row: exact entry, stop, target 1, target 2. Below: proposed entry condition, risk thesis, created timestamp, relevant session, educational context. Timeline: published, triggered, stop changed, partial exit, final exit, archived; every change immutable and attributed.

The terminal is a research and self-directed journaling product concept. It should not imply IWM manages customer brokerage accounts or executes trades unless an appropriately authorized service is built and approved.

06 / IMPLEMENTATION BLUEPRINT

Customer journey: three simple stages

Stage	What the visitor sees	Engineer response
1. Choose	Select desk and 1 / 6 / 12 months. One clear button.	Load eligible products and server-verified price. Preserve desk and term selection.
2. Join	Enter email, review exact total, consent to recurring billing, open secure provider checkout.	Passwordless email link or authentication; quote snapshot; server-only checkout initiation.
3. Access	One success screen, “Enter Member Terminal” button and optional “Connect Discord”.	Verify provider status; generate entitlements; email confirmation; Discord optional.

What must appear before payment

- Product / desk name, duration, region/currency, amount charged now, tax breakdown and total.
- Whether it automatically renews; renewal interval, next charge date and expected renewal amount.
- Easy access to terms, cancellation/refund policy and risk disclosure. Explicit recurring consent where applicable.
- A single visible “Pay securely” action that is never enabled if any required price data is missing.

No-price rule

The prototype intentionally displays “Connect verified price catalogue” rather than inventing figures. In production this must be replaced by a real confirmed amount; visitors should never reach payment with a missing quote.

Recommended sign-in

Use a passwordless email verification link when supported and safe, so first-time visitors do not have to manage a long registration. Returning members can log in, resume interrupted checkout and view purchases using the same email identity.

07 / IMPLEMENTATION BLUEPRINT

Payment, renewal, cancellation and access

Provider-neutral implementation sequence

- 1. User picks approved SKU and term; backend returns signed server-side price snapshot.
- 2. Backend creates pending checkout with an idempotency key and verified product metadata.
- 3. Visitor completes payment in an eligible hosted provider checkout.
- 4. Callback never alone grants entitlement; backend verifies authoritative payment / subscription state.
- 5. The verified subscription grants only the purchased desk(s), with a paid-through timestamp.
- 6. Member may connect Discord; role mapping is enforced server-side.
- 7. Renewal events reconcile, extend access exactly once and generate appropriate receipt.

Subscription lifecycle

State	Access behavior
Checkout pending	No paid access. Preserve pending order for safe resumption.
Provider-confirmed active	Grant desk entitlements through provider-confirmed paid-through time.
Payment failed / retry	Show issue; reconcile provider policy and do not silently extend access.
Cancel at period end	Stop future renewals; keep purchased access until exact paid-through timestamp.
Expired / chargeback / revoked	Remove or adjust entitlements and Discord roles per agreed terms and provider facts.

Payment details, plan prices, tax treatment, recurring eligibility and processor implementation must be confirmed with IWM. Revolut was discussed earlier, but the blueprint is provider-neutral and does not assume approval or availability.

08 / IMPLEMENTATION BLUEPRINT

Data model and API contracts

Record	Core fields
desks	id, public_name, legacy_group_name, live, access_code, discord_role_id
prices	id, desk_id, currency, amount_minor, tax_mode, interval_months, billing_policy, active, version
users	id, email_unique, auth_provider, verified_at, created_at
subscriptions	id, user_id, price_id, provider_id, status, period_start, paid_through, cancel_at_end
entitlements	id, user_id, desk_id, starts_at, ends_at, revoked_at, source_subscription_id
trade_plans	id, desk_id, symbol, exchange, side, entry, stop, target1, target2, rationale, status, published_at
trade_events	id, trade_id, event_type, event_time, author_id, old_values, new_values, note, immutable_audit_id
trade_exits	id, trade_id, action_sell_or_cover, execution_or_model, exit_price, qty_fraction, timestamp, notes
user_journal	id, user_id, trade_id_optional, member_entry, member_exit, size, notes, timestamps
billing_events	provider_event_id_unique, type, subscription_id, received_at, processed_at, result
discord_connections	user_id, discord_user_id, linked_at, role_sync_state, last_sync_at

Minimum API routes

GET /catalog, /desks/:id, /members/me, /members/me/trades, /members/me/billing; POST /checkout/session, /auth/magic-link, /discord/connect; PATCH /billing/cancel-renewal; POST /webhooks/payment-provider. Never trust desk_id, price or user roles received from the browser without server validation.

Data integrity

- Use decimal-safe money values and precise decimal trade values; do not use binary floats for billing.
- Published trade plans and their update events need immutable histories; archive all statuses.
- Deduplicate payment provider events; use transactional entitlement writes and a reconciliation task.
- Permissions apply to server APIs, file URLs, real-time streams and Discord sync—not simply hidden menus.

09 / IMPLEMENTATION BLUEPRINT

Conversion, usability and trust checklist

Remove signup friction

- Show the visual example trade before the price cards; it demonstrates value without a sales pitch.
- Keep navigation to Trade Examples, Trading Desks, Member Terminal and Membership.
- Each desk gets one sentence describing who it serves, not a long duplicated feature list.
- Keep the selected desk and term visible through checkout; one editable order summary.
- Only ask for email and essential information before checkout; no compulsory Discord connection before payment.
- Display verified real price and recurring terms upfront, never only after the final click.
- On mobile, use readable cards and one simple persistent membership CTA.

Build confidence without fake urgency

- If displaying customer testimonials or results, obtain documented permission and accurate context.
- If showing real historical trade logs, retain losing, stopped-out, cancelled and unfilled plans.
- Avoid fake countdowns, fabricated trades, exaggerated returns, promises of income or “guaranteed profit”.
- Show a visible support contact, company identity, policies and clear risk disclosures.
- Performance and trade ideas require jurisdiction-specific compliance review before publication.

Product analytics events

Track: hero_example_opened, trade_example_changed, desk_selected, period_selected, checkout_started, checkout_failed, checkout_completed_verified, member_terminal_entered, discord_connected, cancellation_requested. Measure drop-off at each step without collecting full card or trading-account credentials.

10 / IMPLEMENTATION BLUEPRINT

Acceptance tests and handoff conditions

- [ ] Five desks shown, including Swing Trade, with accurate legacy mapping.
- [ ] Prominent IWM ACADEMY name and full academy name on desktop and 360px mobile.
- [ ] Example selector swaps exact entry, stop loss, targets, exit, direction and illustration chart.
- [ ] Long plan uses Buy → Sell; short plan uses Sell Short → Buy to Cover.
- [ ] No synthetic trade is labelled live, verified performance or an executed customer order.
- [ ] 1 / 6 / 12 month selector preserves chosen desk through the checkout journey.
- [ ] Production Pay button is disabled without verified price, tax and renewal terms.
- [ ] Phone/email UX uses few fields, validates gracefully and supports returning accounts.
- [ ] Checkout callbacks and webhook replays cannot create double charges or unauthorized access.
- [ ] Only provider-confirmed payment activates member entitlement; access is server-gated.
- [ ] Successful renewal extends paid-through date once; failed billing uses an accurate status.
- [ ] Cancel future renewals from member terminal; access survives until paid-through date.
- [ ] Discord permissions follow the selected purchased desk and expire when access ends.
- [ ] Mobile has zero horizontal overflow; focus, keyboard controls and text contrast pass QA.
- [ ] No actual prices, performance or regulatory status are invented in code or copy.

Required owner inputs to publish

Supply approved official logo, exact desk / bundle catalogue, current 1-6-12 month prices and tax treatment, merchant payment credentials, real company legal name, renewal/refund policy, member support contact, risk disclosures, and official Discord role IDs.

Source vs. prototype boundary

The new interactive HTML is a standalone front-end prototype: no user accounts, payments, broker connectivity, Discord sync or market-data APIs are operational. The PDF defines how those functions should be implemented. Review the website and compliance requirements before deployment.

Reviewed public site: https://iwm.academy/ (retrieved 09 November 2026; public homepage extract did not expose Swing Trade).
